A;Status: nucleic acid sequence not shown; translation not shown
A;Molecule type: DNA
A;Molecule type: DNA
A;Molecule type: DNA
A;Rosidues: 1-134 <BLAT>
A;Experimental source: GB:AB000177; GB:U00096; NID:g1786955; PIDN:AAC73830.1; PID:g1786957;
A;Experimental source: strain K-12, substrain MG1655
C;Comment: This is one of the proteins, encoded by the fii-tolAB gene cluster, that is is Genetics:
A;Gene: ybgC
A;Map position: 17 min
A;Start codon: GTG
C;Superfamily: 15.5K protein (tolAB operon 5' region)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         CiSpecies: Escherichia coli

A69052

ribofiavin synthase beta subunit - Methanobacterium thermoautotrophicum (strain Delta H)

ribofiavin synthase beta subunit - Methanobacterium thermoautotrophicum

c;Species 16-Dec-1997 #sequence_revision 05-Dec-1997 #text_change 05-May-2000

C;Accession: A69052

C;Accession: A69052

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Science 269:496-512(1995).
-!- FUNCTION: This protein is one of the 16S ribosomal RNA binding proteins (By similarity).
-!- SIMILARITY: Belongs to the S15P family of ribosomal proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                   01-NOV-1995 (Rel. 32, Created)
01-NOV-1995 (Rel. 32, Last sequence update)
28-FBB-2003 (Rel. 41, Last annotation update)
30S ribosomal protein S1s.
(RPSO-A OR RPSI5-A OR HI1328) AND (RPSO-B OR RPSI5-B OR HI1468)
Haemophilus influenzae.
                                                                     .

C. I- FUNCTION: Binds double-stranded DNA tightly but without sequence
chromosome, suggesting a role in chromatin archites is therefore
chromosome, suggesting a role in chromatin by similarity.
C. I- SUBINIT: Homoterramer (By similarity).
C. I- SUBINIT: Homoterramer (By similarity).
C. I- SUBINITY: Belongs to the archeoby repressing transcription. Regulation of DNA-based activities is therefore
achieved at the chromatin level (By similarity).
C. I- SIMILARITY: Belongs to the archeapal histone-like Alba family.
C. I- SIMILARITY: Belongs to the archeapal histone-like Alba family.
C. I- SIMILARITY: Belongs to the archeapal histone-like Alba content is in no way the European Bioinformatics Institutes. There are no restrictions on its Couse by non-profit institutions as long as its content is in no way condities requires a license agreement (see http://www.isb-sib.ch/announce/correct or send an email to license@ieb-sib.ch).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

"Comparison of the nucleic acid sequence of anglerfish and mammalian insulin mRNA's from cloned cDNA's.";
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Lophius piscatorius (Allmouth goosefish) (Anglerfish), and Lophius americanus (American goosefish) (Anglerfish). Bustaryota Metazoa, Chordata, Craniata, Vertebrata, Buteleostomi; Actinopterygli; Neopterygli; Teleostei; Suteleostei; Neoteleostei; Acanthomorpha; Paracanthopterygli; Lophilformes; Lophildae; Lophius.
                                                 are derived from a single gene.";
2001. Sci. 15:931-937(1998)
-!- FUNCTION: Insulin decreases blood glucose concentration. It increases cell permeability to monosaccharides, amino acids and fatty acids. It accelerates glycolysis, the pentose phosphate cycle, and glycogen synthesis in liver.
-!- SUBUNIT: Reterodimer of a B chain and an A chain linked by two
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Score 19; DB 1; Length 115;

-!- FUNCTION: Insulin decreases blood glucose concentration. It increases cell permeability to monosaccharides, amino acids and fatty acids. It accelerates glycolysis, the pentose phosphate cycle, and glycogen synthesis in liver.
-!- SUBCNIT: Heterodimer of a B chain and an A chain linked by two
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

                                                                                                                                                    Canty J.M., Young R.F., Fallavollita J.A.;
Submitted (MAR-1998) to the EMBL/GenBank/DBJ databases.

-!-FUNCTION: Facilitative glucose transporter. This isoform likely mediates the bidirectional transfer of glucose across the plasma membrane of hepatocytes and is responsible for uptake of glucose by the beta cells; may comprise part of the glucose-sensing mechanism of the beta cell. May also participate with the Na(+)/glucose cotransporter in the transcellular transport of glucose in the small intestine and kidney (By similarity).

-!-SUBCELULAR LOCATION: Integral membrane protein.

-!-SIMILARITY: Belongs to the sugar transporter family. Glucose transporter subfamily.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

"Evidence for lateral gene transfer between Archaea and Bacteria from

Toponem sequence of Thermotoga maritima.";

Nature 399:333-328(1999).

-I-FUNCTION: Decarboxylation of S-adenosylmethionine provides the

aminopropyl modety required for spermidine biosynthesis from

putrescine (By similarity) required for spermidine biosynthesis from

putrescine (By similarity) methylsulfonnium salt + CO(2).

-I-CATALYTIC ACTYVITY: S-adenosyl-L-methionium salt + CO(2).

-I-CATALYTIC Belongs to the prokaryotic AdoMetDC family Subfamily
                                                                                                                            28-FEB-2003 (Rel. 41, Created)
28-FEB-2003 (Rel. 41, Last sequence update)
15-MAR-2004 (Rel. 43, Last annotation update)
5-adenosylmethionine decarboxylase proenzyme (EC 4.1.1.50) (AdoMetDC)
(SamDC) (Contains: S-adenosylmethionine decarboxylase beta chain; S-adenosylmethionine decarboxylase alpha chain).
                                                                                                                                                                                                                                                                                                                         Thermotoga maritima.

Nature 390:364-370(1997).

-!- FUNCTION: Riboflavin synthase is a bifunctional enzyme complex catalyzing the formation of riboflavin from 5-amino-6-(1'-D)-ribityl-amino-2,4(1H,3H)-pyrimidinedione and L.3,4-dihydrohy-2-butanone-4-phosphate via 6,7-dimethyl-8-lumazine. The beta subunit
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          16-0CT-2001 (Rel. 40, Created)

       2,4(14,3H)-pyrimidinedione with L.3,4-dihydrohy-2-butanone-4-phosphate yielding 6,7-dimethyl-8-lumazine (By similarity).
-!- CATALYTIC ACTIVITY: 2 6,7-dimethyl-8-(1-0-tibityl)lumazine = riboflavin + 4-(1-0-ribitylamino)-5-amino-2,6-dihydroxypyrimidine.
-!- PATHAY: Riboflavin blosynthesis; last step.
-!- SIMILARITY: Belongs to the DWRL synthase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

-Ir VINCTION: Riboflavin synthase is a bifunctional enzyme complex
-Ir VINCTION: Riboflavin synthase is a bifunctional enzyme complex
catalyzing the formation of riboflavin from 5-amino-6 (11'-D)
- ribity1-amino-2,4(1H,3H)-pyrimidinedione and L-3,4-dihydrohy-2-
butanone-4-phosphate via 6,7-dimethy1-8-lumazine. The beta subunit
catalyzes the condensation of 5-amino-6 (11'-D)-ribity1-
amino-2,4(1H,3H)-pyrimidinedione with L-3,4-dihydrohy-2-
butanone-4-phosphate yielding 6,7-dimethy1-8-lumazine (By
similarity).
-I- CATALYTIC ACTIVITY: 2 6,7-dimethy1-8-(1-D-ribity1)lumazine =
riboflavin + 4-(1-D-ribity4mino)-5-amino-2,6-dihydroxypyrimidine.
-I- PATHWAY: Riboflavin biosynthesis; last step.
-I- SIMILARITY: Belongs to the DMRL synthase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

-!-FUNCTION: Riboflavin synthase is a bifunctional enzyme complex catalyzing the formation of riboflavin from 5-amino-6-(1'-D)-

ribityl-amino-2,4(1H,3H)-pyrimidinedione and L-3,4-dihydrohy-2-

butanome-4-phosphate via 6,7-dimethyl-8-lumazine. The beta subunit catalyzes the condensation of 5-amino-6-(1'-D)-ribityl-

amino-2,4(1H,3H)-pyrimidinedione with L-3,4-dihydrohy-2-

butanome-4-phosphate yielding 6,7-dimethyl-8-lumazine (By
                                                                                                                                                                                                                                                                                                                                                                                                                                 -1- CATALYTIC ACTIVITY: 2 6,7-dimethyl-8-(1-D-ribityl)lumazine = riboflavin + 4-(1-D-ribitylanino)-5-amino-2,6-dihydroxypyrimidine.
-1-PATHWAY: Riboflavin biosynthesis; last step.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               MEDINE-88115138; PubMed=2828309; Deich R.A., Metcalf B.J., Finn C.W., Farley J.E., Green B.A.; Deich R.A., Metcalf B.J., Finn C.W., Farley J.E., Green B.A.; Coning of genes encoding a 15,000-dalton peptidoglycan-associated outer membrane lipoprotein and an antigenically related 15,000-dalton J. DNA Res. 8:123-140(2001).

-!- FUNCTION: Riboflavin synthase is a bifunctional enzyme complex catalyzing the formation of riboflavin from 5-amino-6-(1'-D)-ribityl-amino-2,4(1H,3H)-pyrimidinedione and L-3,4-dihydrohy-2-butanone-4-phosphate via 6,7-dimethyl-8-lumazine. The beta subunit catalyzes the condensation of 5-amino-6-(1'-D)-ribityl-amino-2,4(1H,3H)-pyrimidinedione with L-3,4-dihydrohy-2-butanone-4-phosphate yielding 6,7-dimethyl-8-lumazine (By

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        "Differences in the regulation of messenger RNA for housekeeping and specialized-cell ferritin. A comparison of three distinct ferritin complementary DNAs, the corresponding subunits, and identification of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
-i- TISSUE SPECIFICITY: Seems to be restricted to the hematopoietic compartment. Expressed in peripheral blood, spleen, and bone marrow, at moderate levels in lung, small intestine and testis, a minimal levels in other tissues. Also found in vascular smooth muscle cells and hematopoietic malignancies.
-i- INDUCTION: By phorbol ester and inflammatory cytokines, such as TNF-alpha, or ILI-beta, but not by growth factors.
-i- SIMILARITY: Contains 1 BG1-2 homology 1 (BH1) domain.
-i- SIMILARITY: Belongs to the BG1-2 family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             SEQUENCE FROM N.A.

Biol. Inorg. Chem. 4:243-256(1999).
-!- FUNCTION: Ferritin is an intracellular molecule that stores iron in a soluble, nontoxic, readily available form. The functional molecule, which is composed of 24 chains, is roughly spherical and contains a central cavity into which the polymeric ferric iron
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              MISCELLANBOUS: THERE ARE THREE TYPES OF PERRITIN SUBUNITS: L, M AND H CHAINS IN AMPHIBIA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   100.0%; Score 19; DB 1; Length 176; 100.0%; Pred. In "The complete genome sequence of Haemophilus ducrey!.";
Submitted (JUN-2003) to the EMBL/GenBank/DDBJ databases.
I "The complete genome sequence of Haemophilus ducrey!.";
C -- FUNCTION: Catalyzes a salvage reaction resulting in the formation of AMP, that is energically less costly than de novo synthesis.
C -- CATALYTIC ACTIVITY: AMP + diphosphate = adenine + 5-phospho-alpha-
D. Tiboses 1-diphosphate.
C -- CATALYTIC HOMOdimer (By similarity).
C -- SUBGUNIT: Homodimer (By similarity).
C -- SUBCLIDIAR LOCATION: Cytoplasmic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This SWISS-PROT entry is copyright. Trystal structure of liganded and unliganded forms of bovine plasma
"Crystal structure of liganded and unliganded forms of bovine plasma
"Trianch binding protein.";

L. Biol. Chem. 268:10728-10738(1933).

L. FUNCTION: Delivers retinol from the liver stores to the peripheral
tissues. In plasma, the RBP-retinol complex interacts with
transhbyretin, this prevents its loss by filtration through the
kidney glomeruli.

SUBCELLULAR LOCATION: Secreted.

L. SIMILARITY: Belongs to the lipocalin family.
